

Changes in QUIK Workstation 7.27.1

Features of new version

1. The **Instrument full name** and **ISIN** parameters were added to the Positions in instruments table. For the description, see the User's manual, sub-section 3.15.2.
2. The size of the Global client filter toolbar was extended:

When the functionality of client code replacement is used, this feature allows showing the user's name and surname in full.

3. The execution result of failed transactions (for example, request of client dictionaries by the Non-trade instructions module) is not displayed in the system messages window.

Issues resolved

1. Instruments from trading accounts set in the **Ignore trade accounts for tags** setting of the Limits calculation library.
2. An error appeared in CoLibri plugin while closing positions in the derivatives market for clients with the Unified cash position and using the **Collateral liq. ratio of client margin requirement** and **Planned collateral liq. ratio of client margin requirement** parameters as criteria for closing.
3. An error in calculation of the maximum possible quantity to buy and sell in the order entry window and the **Buy** and **Sell** parameters in the Buy/Sell table. This error resulted in incorrect accounting of the funds blocked under previously submitted orders and affected purchasing power calculation for the subsequent orders.
4. The Buy/Sell table was opened erroneously in configuration with unauthorized client code. Unauthorized client code will be substituted to an allowed one in new version.
5. When a user attempted to change his password on the first log in with authorization by login and password set up the error of the following view occurred: Error occurred during handshake.
